

CrescentRating Competency Test

Vibe Coding & Automation Intern

Name _____

Date _____

Submission Deadline: **Sunday, 14 June 2026, 23:59 SGT (GMT+8)**

This test assesses your ability to build, ship, and automate using AI-first tools. We care about real output — working code, live links, and clear thinking. Read each question carefully and show your actual process, not just the polished result.

Section A: Technical & Thinking Questions

Answer in the spaces provided

- 1** You're given a Figma design for a HalalTrip feature page — a "Halal Restaurant Finder" card grid. Describe your exact workflow to turn that Figma file into a live, deployed page. Name the specific tools you'd use at each step.

Expected detail: tool names (not just "a code editor"), how you handle gaps between design and code, where AI fits in, and where you'd deploy.

- 2** You want to build an automation that monitors a public list of top halal travel destinations (e.g. from a webpage or RSS feed), detects when a new destination is added or a ranking changes, and posts a formatted summary to a Discord channel. How would you build this? What tools or services would you use, and how would you handle failures silently so the team isn't spammed with error alerts?

Think through: how you'd detect changes (not just scrape every hour blindly), what "formatted summary" means structurally, and how you'd test it before going live.

- 3** A stakeholder gives you this prompt for an AI agent: "Build me a research agent that finds the top 10 halal-friendly hotels in any city." What's wrong or incomplete about this prompt, and how would you rewrite it to get a reliable, usable output?

Think about: data sources, output format, what "halal-friendly" means operationally, hallucination risk, and how the agent knows when it's done.

- 4** You've been using a vibe coding tool (Claude Code, Cursor, Bolt, v0, etc.) to build something. The AI gives you a solution that works but the UI looks generic and the code is messy. What do you do next, specifically?

Walk us through your actual review and iteration steps.

- 5** The two UI mockups below show two versions of the same halal restaurant card component for a Muslim travel app. One has meaningfully better UX than the other. Pick one and give 3 specific, concrete reasons why — no vague answers like "it looks cleaner."

Consider: information hierarchy, scanability, action clarity, and how well each design serves a Muslim traveler's actual needs.

Section B: Build Task

Submit a live link + brief writeup

Build Task

CrescentRating wants a simple internal tool: a **Muslim Travel Data Dashboard**. It should display key stats about global Muslim travel in a visually compelling, interactive way — designed for a non-technical stakeholder to quickly understand the market opportunity.

Use any vibe coding tool you prefer (v0, Bolt, Lovable, Claude Artifacts, Cursor, etc.). Content should be grounded in CrescentRating's publicly available data (crescentrating.com, GMTI reports).

The dashboard must include:

- At least 3 key metrics as stat cards (e.g. Muslim traveler arrivals, market value, top regions)
- One interactive chart (bar, line, or map — your choice)
- A section showing the top 5 Muslim-friendly destinations with brief tags or indicators
- A clear visual hierarchy — someone should understand the most important number within 3 seconds

DELIVERABLES

- A live URL or working file (GitHub, CodePen, Vercel, etc.) — it must open and run
- One paragraph (max 150 words): tool used, one intentional decision, one thing you'd improve
- Optional: a short Loom or screen recording walkthrough (max 2 min)

How to submit: Compile your written answers in a single PDF (max 1 MB) and include your live link(s). Name your file **CT_YOUR_NAME_VIBE CODING INTERN**. Reply to the test email sent to you (hradmin@crescentrating.com), attaching your completed PDF.

Deadline: Sunday, 14 June 2026, 23:59 SGT
